
Single fitted-shell witness surface $W_\alpha(\tau_1, \tau_2)$
one scale per retained native Wigner–Seitz shell, $0 \le \alpha_s \le 2$
post-hoc producer-checked development; not independently verified
gray: no converged witness found in the bounded search
gray is not a global infeasibility certificate
active fitted witness
literal truncation ($\alpha_s = 1$)
post-hoc RMS spectral threshold, τ_1
post-hoc RMS operator threshold, τ_2
representatives in the minimum-support fitted witness
